

Justification (concise proof): Any linear dependence relationship between columns of  $A$  can be expressed in the form  $A\vec{x} = \vec{0}$ . When  $A$  is row reduced to  $R$ , the columns change but the equation  $R\vec{x} = \vec{0}$  has the same set of solutions.

~~In it~~

In other words, row reduction does not change the dependence relations between the columns. The pivot columns of  $A$  must be linearly independent because the pivot columns of  $A$  must be linearly independent because the pivot columns of  $R$  are linearly independent. Also, non-pivot columns are linear combinations of the prev. pivot columns.
